

## Residence Secured with Internal Vortex Bolt On

Catering for all properties including residential developments, the Vortex Bolt On requires the smallest structural headroom compared to any regular security shutter, rolling almost 50% smaller than standard.

### Varying lath sizes

With a roll zone nearly 50 percent smaller than a standard roller shutter, the Vortex Bolt On offers residential properties a smart solution to bulky hoodboxes.

Using varying lath sizes through-out the shutter curtain, the Vortex Bolt On reduces the required space above the shutter opening.

Engineered to bolt on to the wall as a retrofit product, there is no need for additional works to structural support.

### Radically reduced head space requirement

Without the need for a bulky and unsightly hood box, residential properties and developments greatly benefit from the Vortex product range.

With the bolt on aspect of the product requiring no structural changes to the property, residences can easily recess the shutter in suspended ceilings, as pictured.

As aesthetic weighs so heavily within residential developments, the ability to secure without effecting design is a brilliant benefit of the Vortex Bolt On.
